I realize that it is fairly common in the literature to see mass balance numbers expressed in terms of “m w.e. yr$^{-1}$”, but this mix of SI units with a discipline-specific abbreviation goes against best practices as outlined by the U.S. National Institute of Standards and Technology (NIST). The document at http://www.nist.gov/pml/pubs/sp811/recommends putting the abbreviation in the text rather than in the units (see section 7.5), such as, “Mera Glacier has been losing mass at a water-equivalent rate of -0.1 m yr$^{-1}$,” rather than “Mera Glacier has been losing mass at a rate of -0.1 m w.e. yr$^{-1}$.” Following such best practices makes our literature more accessible to those coming from other fields.
